This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  estimates computed by the Phrap assembly program.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTE: This is a 'working draft' sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 43 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* truns of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

* NOTE: This is a "working draft' sequence. It currently
consists of 16 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
truns of N. but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Direct Submission

CEBU 15A, UK. Familia equilibres; nunquery@sanger.ac.uk Clone requests; clonerequest@sanger.ac.uk

On Aug 21, 2000 this sequence version replaced gi:9843543.

During sequence assembly data is comparaded from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL: Sw: SWISSRORT: Tr:, TREMBL: Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 mapping Group. Further information can be found at http://www.sanger.ac.uk/HGY/Chr20

IMPORTANT: This sequence is not the entire insert of clone RP5-93HH9 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap.

The true left end of clone RP5-1187M17 is at 35737 in this sequence. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequencing problems, such as compressions and repeats; all regions were otherwise noted: all regions were either double-stranded or sequencing problems, such as compressions and repeats; all regions were objection by at least one plasmid subclone or more than one Mi3 subclone; and the assembly was confirmed by restriction digest. RP5-93HH9 is from the library RPCI-5 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/Dacpac/home.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AL160414 35836 bp DNA PRI 15-FEB-2001
Human DNA sequence from clone RP5-931H19 on chromosome 20. Contains
ESTS. GSSs and CpG islands. Contains the OXT gene for oxytocin
(neurophysin I) and the AVP gene for arginine vasopressin
(neurophysin II), complete sequence.
                                                                                                                                                                                                                                                                                                                                                                          ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5807681
CENERAL INFORMATION:
APPLICANT: Giordano, Antonio
APPLICANT: Baldi, Alphonso
TITLE OF INVENTION: METHODS FOR THE DIAGNOSIS AND PROGNOSIS
TITLE OF INVENTION: OF CANCER
NUMBER OF SEQUENCES: 115
CORRESPONDENCE ADDRESS:
ADDRESSEE: SEIDEL, GONDA, LAVORGNA & MONACO, P.C.
STREET: Suite 1800 Two Penn Center Plaza
CITY: Philadelphia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  30.3%; Score 28.2; DB 4; Length 392; 54.8%; Pred. No. 15; tive 0; Mismatches '42; Indels
Patent No. 6262334
GENERAL INFORMATION:
FAPLICANT: ENDEGE, WILSON O., ET AL.
TITLE OF INVENTION: NOVEL HUMAN GENE EXPRESSION
TITLE OF INVENTION: PRODUCTS: II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SOFTWARE: Patentin Release #1.0, Version #1.30

                                                                           The invention relates to a light-repressible promoter (AAA97385), or active fragments thereof (AAA97383, AAA97384), from the gene encoding the pea GTP-binding protein pra2. The invention also relates to an expression cassette containing the pra2 promoter or its active fragments for the expression of a gene under photoinhibitory or dark conditions in a plant, and to transgenic plants, their descendants and plant tissues comprising the expression cassette. The expression cassette of the invention can be used to generate transgenic plants in which deterioration during storage in the dark is prevented. This is particularly useful for agricultural products. The present sequence represents the pea pra2 promoter cis element.

The invention also relates to an expression cassette containing the pra2 promoter or its active fragments for the expression of a gene under photoinhibitory or dark conditions in a plant, and to transgenic plants, their descendants and plant tissues comprising the expression cassette. The expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a light-repressible promoter (AAA97385), or active fragments thereof (AAA97383, AAA97384), from the gene encoding the pea GTP-binding protein pra2. The invention also relates to an expression cassette containing the pra2 promoter or its active fragments for the expression of a gene under photoinhibitory or dark conditions in a plant, and to transgenic plants, their descendants and plant tissues comprising the expression cassette. The expression cassette of the invention can be used to generate transgenic plants in which deterioration during storage in the dark is prevented. This is particularly useful for agricultural products. The present sequence
cassette of the invention can be used to generate transgenic plants in which deterioration during storage in the dark is prevented. This is starticularly useful for agricultural products. The present sequence represents the pea pra2 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               1396 aaaagtaacacatattttgataaatttattactaaaactattttctagtacttgttaatc 1455

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 aaaagtaacacatattttgataaatttattactaaaactattttctagtacttgttaatc

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                         present invention relates to a composition comprising two nucleic

                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

```
The present sequence represents the large circular extrachromosomal element sequence of the Methanococcus jannaschii circular chromosome. The present invention describes M. jannaschii open reading frames from the genome sequence. The invention also describes a computer based system for identifying fragments of the M. jannaschii genome that are homologous to target nucleotide sequences, comprising; (a) data storage means comprising the nucleotide sequence of the 1664976, 58407 or 16550 bp sequence (see AAV21209, AAV21210 and AAV21211), or a nucleotide sequence of the nucleotide sequence of the data storage means to identify a homologous sequence, and (c) retrieval means for comparing a target sequence to the nucleotide sequence of the data storage means to identify a homologous sequence, and (c) retrieval means for obtaining the homologous sequence. The method, which is based on whole genome random sequencing of an autotrophic archaeon M. jannaschii, the genome of which consists of 3 physically distinct elements, a large circular chromosome (the 1664976 bp sequence given in AAV21209), a large circular extra chromosomal element (the 58407) bp sequence given in AAV21211), and a small circular extra chromosomal element (the identification of M. jannaschii genome frammat

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 aaaagtaacacatattttgataaatttattactaaaactattttctagtacttgttaatc 60

                                                         Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 group, useful as labels in allowing repeat analyses on
                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials.                                       The invention relates to a light-repressible promoter (AAA97385), or active fragments thereof (AAA97383, AAA97384), from the gene encoding the pea GTP-binding protein pra2. The invention also relates to an expression cassette containing the pra2 promoter or its active fragments for the expression of a gene under photoinhibitory or dark conditions in a plant, and to transgenic plants, their descendants and plant tissues comprising the expression cassette. The expression cassette of the invention can be used to generate transgenic plants ir which deterioration during storage in the dark is prevented. This is particularly useful for agricultural products. The present sequence

fragments for the expression of a gene under photoinhibitory or dark conditions in a plant, and to transgenic plants, their descendants and plant tissues comprising the expression cassette. The expression cassette of the invention can be used to generate transgenic plants is which deterioration during storage in the dark is prevented. This is particularly useful for agricultural products. The present sequence represents the pea pra2 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               analyses
                                                                                                                                                                                                                                                                                                                                                                                                                                                     group, useful as labels allowing repeat analyses

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                       Length 936;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ttttctcttcccatgaattcacattgctaaagaaaattaccaccttaaaatgtttatccc 1840
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1961 tatagcacaattttcaaaaatatcctagtcttcaaccactcaataattcacaatttccaa 2020
                                                                                                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ИМИМИМИМИМИМИМИМИМИМИМИМИМИМИТААССИМИМИМИМИМИМИМИМИМИМИМИМИМИМ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1709 ttgtatcgtaaatggtaggacatactcatgctacacaattatatcatcactggtcaatca 1768
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1349 tacatctctcttattattattaataaaatgtaaagaaaaatatagtataaaagtaacacat 1408
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acattgaaattaatgaatgttcttttataacgtttgtctatgccgtattacccatatggt

                                                                                                                                                                                                                                cacaatttccaaatcccttgcaaaacatcacaacctctagaaactttgattaataatcta 2068
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   422
                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

New DNA fragment or promoter for expressing a target gene, specifically under photoinhibitory conditions, and for transforming a plant cell or plant to improve quality and prevent deterioration during storage -
                                                                                                                                                                 The invention relates to a light-repressible promoter (AAA97385), or active fragments thereof (AAA97383, AAA97384), from the gene encoding the pea GTP-binding protein pra2. The invention also relates to an expression cassette containing the pra2 promoter or its active fragments for the expression of a gene under photoinhibitory or dark conditions in a plant, and to transgenic plants, their descendants and plant tissues comprising the expression cassette. The expression cassette of the invention can be used to generate transgenic plants in which deterioration during storage in the dark is prevented. This is particularly useful for agricultural products. The present sequence represents the pea pra2 promoter cis element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
